### D200 Cable Installation

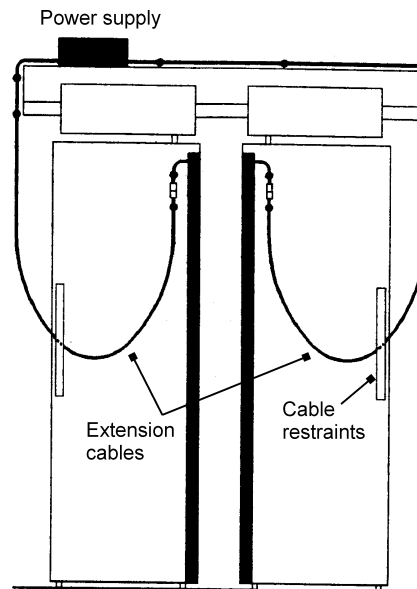

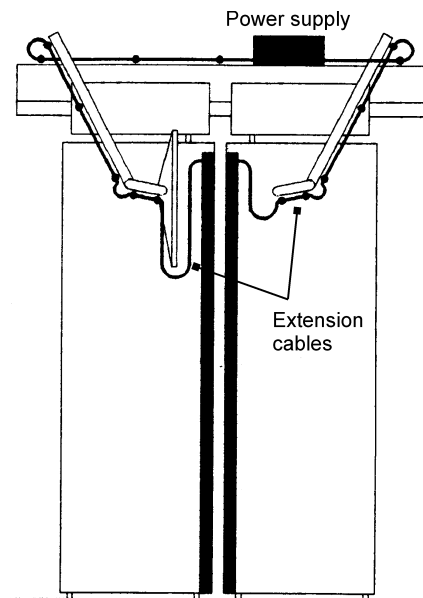

The installer must install the cables carefully to minimize risk of damage or electrical interference. This bulletin explains how to install cables correctly.

1. To avoid electrical interference, do not run extension cables to D200 units in parallel with other power cables.

2. Secure cables to doors using the cable ties and cable restraints supplied.

Alternatively, if the cables are suspended, ensure that they hang freely. Check with car doors open and closed.

3. Position cable ties to avoid sharp bending and kinking of cables.
